

ENVIRONMENT STABILITY REPORT

Observer Unit: OBS-0142

Grow Cycle: Cycle 14 — Week 3

Report Date: 2026-03-01

Overall State	DRIFTING
Stability Index	72%
Environment Type	Indoor Grow Room
Observation Duration	9 days

Observed Pattern

Humidity recovery delay observed after irrigation events. Environment returns to baseline slower than previous cycle baseline.

Risk Window

02:00-05:00 local time

Environmental Behavior

Nighttime airflow insufficient to stabilize humidity gradient after watering. Repeated minor drift accumulated across consecutive nights.

Recommendation

Review airflow timing or reduce irrigation volume during late cycle stage. No immediate intervention required.

Observer does not control or modify environment settings. Report generated from passive environmental observation.
